

**PRE-ANESTHESIA DENTAL FORM**  
**ANSWER ALL QUESTIONS COMPLETELY**

**Last Name:** \_\_\_\_\_ **Pets Name:** \_\_\_\_\_ **Procedure:** \_\_\_\_\_

Prior to placing your pet under anesthesia there are several options to consider regarding their comfort and safety. Risks are involved with every anesthetic procedure for all pets, but **the optional items listed below can help to reduce this**. Be aware that all items listed below are in **addition** to the price of the procedure. Please read the following and ask any questions.

**Procedure Requirements**

**Examination (\$52.00)** - This is required for all new patients and for all pets that have not had a physical examination at My Family Vet within the last year. A full physical exam will be completed by the vet prior to the anesthetic procedure. This is to ensure your pet is healthy enough today to handle the anesthesia and the necessary procedure. This will assist the doctor in getting to know your pet and your pet's needs prior to the procedure.

**Blood Work** – It is required to have a pre-surgical blood profile performed on your pet before any procedure. We always use the safest form of anesthesia for your pet, but this profile can provide information about any pre-existing conditions your pet may have. Kidney and liver values, white blood count, red blood count, platelet counts and many other values are obtained and can determine if your pet is ready for the procedure.

- **Pre-Anesthetic Blood Profile (\$95.00)** this provides basic kidney, liver, glucose, protein and electrolyte values as well as an anemia screen. This is recommended for younger, generally healthy pets and pets that have never been under anesthesia.
- **Comprehensive Diagnostic Profile (\$155.00)** this provides a 12 value blood panel, complete blood count and electrolytes. This panel adds more information on the pancreas, gallbladder and cholesterol. This is highly recommended for ALL PETS OVER 8 YEARS OLD.
- **NO**, my pet has received bloodwork within the last year

**Take Home Pain Management (\$20.00-\$30.00)** your pet will receive an injectable form of pain medication during the procedure to ensure that they are comfortable upon the completion of the procedure. This will generally keep your pet comfortable for up to 12 hours post surgery. Oral pain medications can be used once you get your pet home and are recommended for all surgeries and for dental cleanings with extractions. **If your pet has any teeth extractions or has inflamed gums, pain medication and antibiotics will be prescribed and sent home.**

**General Health Questions:**

- 1.) When was the last time your pet had anything to eat? \_\_\_\_\_ drink? \_\_\_\_\_
- 2.) Please list any medications that you pet is currently taking: (including over-the-counter and homeopathic)

\_\_\_\_\_

\_\_\_\_\_

- 3.) Does your pet have any medical conditions (heart issues, seizures, etc.) that we are unaware of? -

\_\_\_\_\_

**Procedure Options**

**Intravenous Fluids (\$90.00)** this provides an ability to replace blood volume loss, flush the body of injectable anesthesia medications, maintain blood pressure, keep hydrated and provide a direct line to the heart if needed during the procedure

- **YES**, I would like my pet placed on IV fluids.
- **NO**, Please do not place my pet on IV fluids.

**Home Again Microchip Implant (\$47.50)** A small chip is implanted in your pet underneath the skin, between the shoulder blades. All shelters and vet clinics scan found and lost pets and contact the owner if chip is found. This is an excellent method of getting your pet back if they are lost.

- **YES**, I'd like a microchip for my pet today.
- **NO**, Please do not microchip my pet.

**ECG (Electrocardiogram) Screening (\$40.00)** Our ECG screen is performed with a monitor via telemedicine and read by a certified cardiologist. This information will enable us to detect if your pet has any abnormalities in the heart, such as a heart murmur. If detected, we can alter our anesthesia protocols and inform you of any necessary care for the future. This ECG is highly recommended for **PERSIANS, BOXERS, ROTTWEILERS, DOBERMAN, KING CHARLES SPANIELS AND ENGLISH BULLDOGS**.

- **YES**, I would like to have an ECG screen performed today.
- **NO**, Please do not perform an ECG today

**Extractions** - On all our pets, we try our best to keep all of their teeth, but there are instances where the teeth must be extracted. Abscessed, fractured and diseased teeth are a source of infection, pain and toxicity for your pet and must be removed. Bacteria from these issues get into the bloodstream and cause liver and kidney damage and challenge the entire immune system. Please be aware that during the dental cleaning, if your pet has any of the above issues, the tooth will be removed. If extractions are needed, antibiotics will be sent home with your pet.

**Initial** We are required to pull any teeth that are diseased; we cannot call to confirm all extractions. We will attempt to call if your pet has severe dental disease and requires more than 6 teeth that need extracted. We care for your pet and will only do what the doctor feels is medically necessary for them. By signing this form you are authorizing any and all teeth extractions necessary.

**Simple Extraction** - \$ 30.00    **Complex Extraction** - \$ 45.00    **Deciduous Extraction** - \$ 30.00

**Dental Radiographs (\$75.00)** - Dental radiology is the most vital tool in veterinary dentistry. Dental x-rays provide us with valuable information about the condition of your pet's teeth and jaw. Having x-rays performed could make extracting teeth easier and less traumatic for your pet viewing "inside" many times reveals hidden and often undiagnosed conditions. Routine x-rays can reveal hidden cavities, decay, and infections that can seriously impact your pet's overall health as well as their comfort and ability to eat.

- o **YES**, perform routine elective dental radiographs
- o **NO** Thanks.

**Initial Dental x-rays are required if:**

- **Grade 3 – 4 Dental Disease is Present**
- **Any teeth that have lesions, fractures, bi-furcations**
- **Grade 1 – 2 Dental Disease w/ subgingival concerns &/or multiple extractions needed**

### **Optional Take Home Treatments**

**These items are located at checkout**

**OraVet Take Home Sealant Kit** This sealant is applied to the teeth and gums today after the dental cleaning and creates an invisible barrier that prevents plaque/tartar and bacteria from attaching to the teeth. Start applying 2 weeks after the dental cleaning and continue once weekly to maintain the barrier.

- o **YES**, Send a kit home with my pet today.
- o **NO** Thanks.
